Face Mask Detection Overview:

For the face mask detection task, three different object detection models in the TensorFlow object detection model were trained and tested on the face mask dataset to compare their accuracy and choose the best model for face mask detection. Table 1 shows the models and their accuracies.

#	Model	Image	Accuracy
		Size	
1	Faster R-CNN	800*1333	99.8%
	Inception		
	ResNet V2		
2	Faster R-CNN	640*640	81.8%
	Inception		
	ResNet V2		
3	Faster R-CNN	640*640	95%
	ResNet 152 V1		

#	Model	Image Size	Accuracy
1	Faster R-CNN Inception ResNet V2	800*1333	99.8%
2	Faster R-CNN Inception ResNet V2	640*640	81.8%
3	Faster R-CNN ResNet 152 V1	640*640	95%

The Faster R-CNN Inception ResNet V2 800*1333 was selected due to its highest accuracy, i.e., 99.8%.

Faster R CNN Model:

The Faster R-CNN includes the Region Proposal Network (RPN) and the Fast R-CNN as the detector network. The input image is passed through the Convolutional Neural Networks (CNN) Backbone to extract the features. The RPN then suggests bounding boxes that are used in the Region of Interest (ROI) pooling layer to perform pooling on the image's features.

MobileNetV2 model:

The MobileNet V2 model is designed and modeled using python libraries namely Tensorflow, Keras, and OpenCV. The model we used is the MobileNetV2 of a convolutional neural network. The method of using MobileNetV2 is called using

Transfer Learning. Transfer learning is using some pre-trained models to train your present model and get the prediction which saves time and makes using training the different models easy. We tune the model with the hyperparameters: learning rate, number of epochs, and batch size. The model is trained with a dataset of images with two classes, with mask and without a mask. The dataset has 1913 images with mask class and 1918 images without mask class.

Accuracy:

```
super(Adam, self).__init__(name, **kwargs)
INFO] training head...
      of training mean.
